Project Description

Project overview

How much the company can pay out the dividend to the investors. That's the one of the keys to decide the invest. So, we need to know what kind of financial statement effect to dividend is for wise invest decision making. Using the KOSPI, KOSDAQ listing company's financial statement to find out what kind of statements are sufficient to predict the dividend. And make the model to test the statements what we chose is important factor in investment decisions.

Project Goal

To identify the increase or decrease of dividends in 2018 compared to 2017, compare the characteristics of increased companies with the characteristics of decreased companies, and predict the increase or decrease in 2019

What is dividend?

Dividends are a decision-making process that divides a company's short-term net profit between dividends and retained earnings. Through this, the company decides whether to share the net profit earned through management activities by giving dividends to shareholders or to reserve profits and use them for future investments. For investors, it helps them decide whether they can recover their investment with stable dividends.
